

SALES PERFORMANCE DASHBOARD USING POWER BI

1. Introduction

The objective of this project was to develop an interactive Power BI dashboard capable of transforming transactional e-commerce data into actionable business insights. The dashboard was designed to support executive decision-making by presenting sales trends, customer behavior, operational performance, and marketing effectiveness in a clear and interactive format.

Unlike static reports, this dashboard enables users to dynamically filter and explore the data through interactive slicers while maintaining a clean executive layout.

2. Objectives

The primary objectives of this project were:

- Analyze overall sales performance
- Monitor key business KPIs
- Identify top-performing products
- Evaluate referral source effectiveness
- Analyze payment preferences
- Track order fulfillment status
- Measure coupon utilization
- Provide actionable business recommendations

3. Dataset Overview

The dataset consists of cleaned e-commerce transaction records prepared during Project 1.

Major attributes include:

Field	Description
Order ID	Unique Order Identifier
Order Date	Transaction Date
Customer ID	Customer Identifier

Field	Description
Product	Purchased Product
Quantity	Units Purchased
Unit Price	Price Per Unit
Total Price	Order Revenue
Order Status	Delivery Status
Payment Method	Payment Type
Referral Source	Customer Acquisition Channel
Coupon Code	Promotional Code

4. Dashboard Components

The dashboard consists of:

KPI Cards

- Total Revenue
- Total Orders
- Total Customers
- Average Order Value
- Average Quantity per Order

Visualizations

- Revenue Trend
- Revenue by Product
- Order Status Distribution
- Payment Method Analysis
- Referral Source Performance
- Coupon Usage
- Monthly Revenue Heatmap
- Top Products by Quantity

Interactive Filters

- Year
 - Product
 - Order Status
 - Payment Method
 - Referral Source
 - Coupon Code
-

5. Important DAX Measures

Total Revenue

Total Revenue =

SUM('Dataset'[TotalPrice])

Calculates total sales generated across all transactions.

Total Orders

Total Orders =

COUNT('Dataset'[OrderID])

Counts the total number of customer orders.

Total Customers

Total Customers =

DISTINCTCOUNT('Dataset'[CustomerID])

Returns the number of unique customers.

Average Order Value

Average Order Value =

DIVIDE([Total Revenue],[Total Orders])

Calculates the average revenue generated per order.

Average Quantity per Order

Average Quantity / Order =
AVERAGE('Dataset'[Quantity])

Measures the average number of products purchased in each transaction.

6. Key Insights

- The business generated approximately **\$1.26M** in total revenue.
 - Printers and Laptops contributed the highest revenue among all product categories.
 - Instagram emerged as the strongest customer acquisition channel, followed by Email and Google.
 - Payment methods were evenly distributed, indicating diverse customer payment preferences.
 - Customers purchased an average of **2.95 items** per order, highlighting opportunities for bundled promotions.
-

7. Business Recommendations

Based on the dashboard analysis:

- Prioritize inventory planning for high-revenue products.
 - Increase marketing investment on Instagram.
 - Maintain multiple payment methods to enhance customer experience.
 - Introduce targeted offers to encourage larger basket sizes.
-

8. Dashboard Design Approach

The dashboard was designed following modern Business Intelligence best practices:

- KPI-first layout
- Interactive filtering
- Consistent color palette
- Minimal visual clutter

- Executive storytelling
 - Action-oriented insights
 - Professional dashboard hierarchy
-

9. Conclusion

This project demonstrates how Power BI can transform raw transactional data into an executive dashboard that supports data-driven decision-making. Through interactive visualizations, DAX calculations, and business storytelling, the dashboard provides a comprehensive overview of sales performance while enabling stakeholders to identify opportunities for operational and strategic improvements.
